GERHARD PEGEL

PROMBIX

LET ME INTRODUCE MYSELF:

NAME: GERHARD PEGEL

AGE: 43

COMPANY: WEHKAMP

TITLE: CLOUD & MONITORING ENGINEER

FIRST THINGS FIRST

- Goal
- Why?
- How?
- What's the status?
- Now what?

GOAL

- Create a tool to combine best of 2 worlds like monitoring Cloud services and On-Prem systems.
- Automatically discover Prometheus end-points to collect metrics.
- Code this in Python so anyone should be able to use it.
- Make it open source so anyone is able to contribute to it.

WHY?

- One tool to rule them all!
- Level-up my basic Python coding skills.
- Because it is fun to do.

HOW?

- Combine tools like:
 - Zabbix
 - Prometheus
 - Grafana
 - Consul
 - Jenkins
 - ...
- While using:
 - Git
 - Docker
 - Python3
 - ...

WHAT'S THAT STATUS?

- Silly question, it's never done.
- Show a live demo

NOW WHAT?

- It's still 'Work In Progress'
- Feel free to contribute

ANY QUESTIONS?

```
client = docker.from_env()
print('Hello, ' + os.getlogin() + '! Please wait while all or
zabbix = client.containers.run("zabbix/zabbix-appliance:late
         name="zabbix-monitoring",
         ports={'80/tcp': 81},
         detach=True)
zabbix_agent = client.containers.run("zabbix/zabbix-agent:land.containers.run")
         name="zabbix-agent",
          links={'zabbix-monitoring': 'zabbix-server'},
         volumes={'/Users/gpegel/Git/prombix/config/zabbix_config
         detach=True)
grafana = client.containers.run("grafana/grafana:latest",
         name="grafana",
         ports={'3000/tcp': 3000},
         environment=["GF_INSTALL_PLUGINS=grafana-clock-panel,gra
          links={'zabbix-monitoring': 'zabbix-server'},
          detach=True)
prometheus = client.containers.run("prom/prometheus:latest"
         name="prometheus",
         ports={'9090/tcp': 9090},
          volumes={'/Users/gpegel/Git/prombix/config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/prometheus_config/
          detach=True)
         get_ip(container, network_name="bridge"):
         nw = client.networks.get(network_name)
         ip = [_.attrs['NetworkSettings']['Networks']['bridge']['
          return ip
zabbix_ip = get_ip(zabbix)
zabbix_agent_ip = get_ip(zabbix_agent)
grafana_ip = get_ip(grafana)
prometheus_ip = get_ip(prometheus)
print("IP of Zabbix Server in Docker network is : " + zabbix
print("IP of Zabbix Agent in Docker network is : " + zabbix_
print("IP of Grafana in Docker network is : " + grafana_ip -
print("IP of Prometheus in Docker network is : " + prometheu
print("Containers started, have a nice day!\n")
```
